

# Security Assessment Report Hyperlane Sealevel Programs

September 20, 2024

# **Summary**

The sec3 team (formerly Soteria) was engaged to do a thorough security analysis of the Hyperlane Sealevel Solana smart contract programs.

The artifact of the audit was the source code of the following smart contracts excluding tests in <a href="https://github.com/hyperlane-xyz/hyperlane-monorepo/tree/78a5aea/rust/sealevel">https://github.com/hyperlane-xyz/hyperlane-monorepo/tree/78a5aea/rust/sealevel</a>

The initial audit was done on commit 78a5aea7181696a62ac412d5686c8253f0b5cf9a of the following smart contracts and shared utilities in July 2023.

- rust/sealevel/programs/mailbox
- rust/sealevel/programs/ism
- rust/sealevel/libraries/ecdsa-signature
- rust/sealevel/libraries/multisig-ism
- rust/sealevel/libraries/hyperlane-sealevel-token
- rust/sealevel/programs/hyperlane-sealevel-token
- rust/sealevel/programs/hyperlane-sealevel-token-collateral
- rust/sealevel/programs/hyperlane-sealevel-token-native
- rust/sealevel/programs/validator-announce
- rust/sealevel/libraries/access-control
- rust/sealevel/libraries/account-utils
- rust/sealevel/libraries/hyperlane-sealevel-connection-client
- rust/sealevel/libraries/interchain-security-module-interface
- rust/sealevel/libraries/message-recipient-interface
- rust/sealevel/libraries/serializable-account-meta

The audit revealed 8 issues or questions. This report describes the findings and resolutions in detail.

# **Table of Contents**

Appendix: Methodology and Scope of Work	15

# **Result Overview**

Issue	Impact	Status
[L-1] Encode data in all set_return_data()	Low	Resolved
[L-1] Enable runtime overflow checks	Low	Resolved
[I-1] Duplicated signatures allowed	Informational	Acknowledged
[I-2] Signature malleability	Informational	Acknowledged
[I-3] Inconsistent comments	Informational	Acknowledged
[I-4] Create a 0 sized account owned by the system_program	Informational	Acknowledged
[I-5] TODO cleanup	Informational	Acknowledged
[I-6] Make the verify in multisig-ism lib more self-contained	Informational	Acknowledged

# **Findings in Detail**

## [L-1] Encode data in all set\_return\_data()

The data in the following **set\_return\_data** may have trailing zeros. It's recommended to encode them too.

```
/* sealevel/programs/mailbox/src/processor.rs */
678 | set_return_data(id.as_ref());
/* sealevel/programs/mailbox/src/processor.rs */
702 | set_return_data(&count.to_le_bytes());
/* sealevel/programs/mailbox/src/processor.rs */
730 | set_return_data(&ret_buf);
/* sealevel/programs/mailbox/src/processor.rs */
750 | set_return_data(root.as_ref());
/* sealevel/programs/mailbox/src/processor.rs */
765 | set_return_data(
766
         &outbox
767
              .owner
             .try to vec()
768
              .map_err(|err| ProgramError::BorshIoError(err.to_string()))?,
769
770 | );
/* sealevel/libraries/hyperlane-sealevel-connection-client/src/lib.rs */
018 | fn set_interchain_security_module_return_data(&self) {
         let ism: Option<Pubkey> = self.interchain security module().cloned();
019
020
         set_return_data(
             &ism.try_to_vec()
021
022
                  .map_err(|err| ProgramError::BorshIoError(err.to_string()))
023
                  .unwrap()[..],
024
         );
025 | }
/* sealevel/programs/ism/multisig-ism-message-id/src/processor.rs */
295 | fn get_validators_and_threshold(
299 | ) -> ProgramResult {
         set return data(
301
             &validators_and_threshold
302
303
                  .try to vec()
304
                  .map_err(|err| ProgramError::BorshIoError(err.to_string()))?,
```

```
305 | );
307 | }

/* sealevel/programs/ism/multisig-ism-message-id/src/processor.rs */
462 | fn get_owner(program_id: &Pubkey, accounts: &[AccountInfo]) -> ProgramResult {
470 | set_return_data(
471 | &access_control_data
472 | .owner
473 | .try_to_vec()
474 | .map_err(|err| ProgramError::BorshIoError(err.to_string()))?,
475 | );
477 | }
```

#### Resolution

This issue has been fixed by PR#2635.

## [L-2] Enable runtime overflow checks

The addition at line 363 may overflow.

```
/* sealevel/programs/mailbox/src/processor.rs */
176 | fn inbox_process(
180 | ) -> ProgramResult {
363 | inbox.processed_count += 1;
```

Consider enabling the runtime overflow check and adding the following in Cargo.toml

```
[profile.release]
overflow-checks = true
```

#### Resolution

This issue has been fixed by PR#4402.

## [I-1] Duplicated signatures allowed

When loading signatures from caller-controlled arguments, it doesn't check if there are duplicated signatures.

```
/* sealevel/programs/ism/multisig-ism-message-id/src/metadata.rs */
024 | impl TryFrom<Vec<u8>> for MultisigIsmMessageIdMetadata {
          fn try from(bytes: Vec<u8>) -> Result<Self, Self::Error> {
044
             let signature count = signature bytes len / SIGNATURE LENGTH;
             let mut validator_signatures = Vec::with_capacity(signature_count);
045
             for i in 0..signature count {
046
                  let signature_offset = SIGNATURES_OFFSET + (i * SIGNATURE_LENGTH);
047
                  let signature = EcdsaSignature::from bytes(
048
049
                      &bytes[signature_offset..signature_offset + SIGNATURE_LENGTH],
050
051
                  .map_err(|_| Error::InvalidMetadata)?;
                  validator_signatures.push(signature);
052
053 I
              }
              Ok(Self {
055
                  validator_signatures,
058
059
              })
060
          }
061 | }
```

However, the signature quorum check is still safe, since validator\_index moves once there is a hit, and there are no duplicated validators due to the check at processor.rs:372.

It's still a good idea to reject duplicated signatures.

```
/* sealevel/libraries/multisig-ism/src/multisig.rs */
034 | pub fn verify(&self) -> Result<(), MultisigIsmError> {
035
          let signed_digest = self.signed_data.eth_signed_message_hash();
          let signed_digest_bytes = signed_digest.as_bytes();
036
          let validator_count = self.validators.len();
038
039
          let mut validator index = 0;
          // Assumes that signatures are ordered by validator
041
042
          for i in 0..self.threshold {
              let signer = self.signatures[i as usize]
043
                  .secp256k1 recover ethereum address(signed digest bytes)
044
045
                  .map err(| | MultisigIsmError::InvalidSignature)?;
              while validator index < validator count && signer != self.validators[validator index] {</pre>
047
                  validator index += 1;
048
049
              }
              if validator index >= validator count {
051
```

```
052
                 return Err(MultisigIsmError::ThresholdNotMet);
053
             }
055
             validator_index += 1;
         }
056
058
         0k(())
059 | }
/* sealevel/programs/ism/multisig-ism-message-id/src/processor.rs */
366 | fn set_validators_and_threshold(
367 | program_id: &Pubkey,
         accounts: &[AccountInfo],
368
         config: Domained<ValidatorsAndThreshold>,
369
370 | ) -> ProgramResult {
        // Validate the provided validators and threshold.
372 | config.data.validate()?;
```

#### Resolution

## [I-2] Signature malleability

The solana secp256k1\_recover function does not prevent signature malleability. This is in contrast to the Bitcoin secp256k1 library, which does prevent malleability by default. Solana accepts signatures with S values that are either in the high order or in the low order, and it is trivial to produce one from the other.

Reference: <a href="https://docs.rs/sol-chainsaw/">https://docs.rs/sol-chainsaw/</a>

However, for the same reason mentioned in [I-1] (the validator\_index moves once a hit is found), it's not possible to take advantage of the signature malleability to break the check.

Consider rejecting signatures with high-order S values to prevent malleability.

```
/* sealevel/programs/validator-announce/src/processor.rs */
340 | fn verify validator signed announcement(
         announce: &AnnounceInstruction,
341
         validator announce: &ValidatorAnnounce,
343 | ) -> Result<(), ProgramError> {
         let announcement = Announcement {
344
345
             validator: announce.validator,
             mailbox_address: validator_announce.mailbox.to_bytes().into(),
346
             mailbox_domain: validator_announce.local_domain,
347 l
             storage_location: announce.storage_location.clone(),
348
349
350
         let announcement_digest = announcement.eth_signed_message_hash();
351
         let signature = EcdsaSignature::from_bytes(&announce.signature[..])
              .map_err(|_| ProgramError::from(Error::SignatureError))?;
352
354
         let recovered_signer = signature
              .secp256k1_recover_ethereum_address(&announcement_digest[..])
355
              .map_err(|_| ProgramError::from(Error::SignatureError))?;
356
         if recovered_signer != announcement.validator {
358
              return Err(ProgramError::InvalidAccountData);
359
360
         }
         0k(())
362
363 }
```

#### Resolution

#### [I-3] Inconsistent comments

At processor.rs:173, N+2..M. should be N+3...M.

At plugin.rs:108 and plugin.rs:217, it's a token transfer instead of burning the tokens.

#### Resolution

## [I-4] Create a 0 sized account owned by the system\_program

An account owned by the system program with 0 space is confusing. Potentially, it cannot prevent the account creation being called again so that this contract may be initialized several times, which is not the intention of the initialization process.

Although it doesn't seem to have side effects for this initializer, consider allocating more space instead.

```
/* sealevel/programs/hyperlane-sealevel-token-native/src/plugin.rs */
073 | fn initialize<'a, 'b>(
         program id: &Pubkey,
074
075
         system_program: &'a AccountInfo<'b>,
076
         token account: &'a AccountInfo<'b>,
         payer_account: &'a AccountInfo<'b>,
077
         accounts iter: &mut std::slice::Iter<'a, AccountInfo<'b>>,
078
079 | ) -> Result<Self, ProgramError> {
         // Account 0: Native collateral PDA account.
080
         let native collateral_account = next_account_info(accounts_iter)?;
081
         let (native_collateral_key, native_collateral_bump) = Pubkey::find_program_address(
082
083
             hyperlane_token_native_collateral_pda_seeds!(),
             program_id,
084
085
         );
         if &native_collateral_key != native_collateral_account.key {
086
             return Err(ProgramError::InvalidArgument);
087
088
         }
089
         // Create native collateral PDA account.
090
         // Assign ownership to the system program so it can transfer tokens.
091
         create_pda_account(
092
             payer account,
093
094
             &Rent::get()?,
095
             0,
096
             &solana program::system program::id(),
             system_program,
097
             native collateral account,
098
099
             hyperlane_token_native_collateral_pda_seeds!(native_collateral_bump),
100
         )?;
105 | }
```

#### Resolution

## [I-5] TODO cleanup

```
/* sealevel/libraries/hyperlane-sealevel-token/src/processor.rs */
411 | let message = TokenMessage::read_from(&mut message_reader)
412 | .map_err(|_err| ProgramError::from(Error::TODO))?;
504 | let message = TokenMessage::read_from(&mut message_reader)
505 | .map_err(|_err| ProgramError::from(Error::TODO))?;
```

#### Resolution

### [I-6] Make the verify in multisig-ism lib more self-contained

```
/* sealevel/libraries/multisig-ism/src/multisig.rs */
034 | pub fn verify(&self) -> Result<(), MultisigIsmError> {
          let signed_digest = self.signed_data.eth_signed_message_hash();
035
          let signed_digest_bytes = signed_digest.as_bytes();
036
037
          let validator_count = self.validators.len();
038
          let mut validator index = 0;
039
040
041
         // Assumes that signatures are ordered by validator
042
          for i in 0..self.threshold {
              let signer = self.signatures[i as usize]
043
044
                  .secp256k1_recover_ethereum_address(signed_digest_bytes)
                  .map_err(|_| MultisigIsmError::InvalidSignature)?;
045
046
              while validator_index < validator_count && signer != self.validators[validator_index] {</pre>
047
                  validator_index += 1;
048
049
              }
050
              if validator index >= validator count {
051
052
                  return Err(MultisigIsmError::ThresholdNotMet);
053
              }
054
              validator_index += 1;
055
          }
056
057
058
         0k(())
059 | }
```

The correctness of this code assumes (1) the threshold <= validator\_count and (2) there is no duplications in the validators.

These conditions are currently met because this function is only invoked by multisig-ism-message-id and the threshold and validators are loaded from a PDA owned by multisig-ism-message-id. When setting the validators and threshold, the contract does the validations.

```
/* sealevel/programs/ism/multisig-ism-message-id/src/processor.rs */
239 | fn verify(
244 | ) -> ProgramResult {
249 | let validators_and_threshold = validators_and_threshold(program_id, accounts, message.origin)?;
266 | multisig_ism
267 | .verify()
```

```
268 | .map_err(|err| Into::<Error>::into(err).into())
269 | }
```

However, as an independent module, it may be a good idea to add the checks and make it self-contained.

#### Resolution

# **Appendix: Methodology and Scope of Work**

The sec3 (formerly Soteria) audit team, which consists of Computer Science professors and industrial researchers with extensive experience in Solana smart contract security, program analysis, testing and formal verification, performed a comprehensive manual code review, software static analysis and penetration testing.

Assisted by the sec3 Scanner developed in-house, the audit team particularly focused on the following work items:

- Check common security issues.
  - Missing ownership checks
  - Missing signer checks
  - Signed invocation of unverified programs
  - Solana account confusions
  - Arithmetic over- or underflows
  - Numerical precision errors
  - Loss of precision in calculation
  - Insufficient SPL-Token account verification
  - Missing rent exemption assertion
  - Casting truncation
  - Did not follow security best practices
  - Outdated dependencies
  - Redundant code
  - Unsafe Rust code
- Check program logic implementation against available design specifications.
- Check poor coding practices and unsafe behavior.
- The soundness of the economics design and algorithm is out of scope of this work

# **DISCLAIMER**

The instance report ("Report") was prepared pursuant to an agreement between Coderrect Inc. d/b/a sec3 (the "Company") and Abacus Works, Inc (the "Client"). This Report solely includes the results of a technical assessment of a specific build and/or version of the Client's code specified in the Report ("Assessed Code") by the Company. The sole purpose of the Report is to provide the Client with the results of the technical assessment of the Assessed Code. The Report does not apply to any other version and/or build of the Assessed Code. Regardless of the contents of the Report, the Report does not (and should not be interpreted to) provide any warranty, representation or covenant that the Assessed Code: (i) is error and/or bug free, (ii) has no security vulnerabilities, and/or (iii) does not infringe any third-party rights. Moreover, the Report is not, and should not be considered, an endorsement by the Company of the Assessed Code and/or of the Client. Finally, the Report should not be considered investment advice or a recommendation to invest in the Assessed Code and/or the Client.

This Report is considered null and void if the Report (or any portion thereof) is altered in any manner.

# **ABOUT**

Founded by leading academics in the field of software security and senior industrial veterans, sec3 (formerly Soteria) is a leading blockchain security company. We are also building sophisticated security tools that incorporate static analysis, penetration testing, and formal verification.

At sec3, we identify and eliminate security vulnerabilities through the most rigorous process and aided by the most advanced analysis tools.

For more information, check out our website and follow us on twitter.
